

## USING THE DEVELOPER

For full strength, develop the print for 3-4 minutes with undiluted working solution at 20°C/68°F. Stop, fix, wash, and dry the developed print in the normal manner.

For softer results, the working solution can be diluted up to 15 times with water. With the diluted developer, the development times will have to be lengthened--up to 10 minutes for the highest dilution. To decrease the chances of fogging the print, it is advisable to carry out the longer developments without a safety light. Stop, fix, wash, and dry the print in the normal manner.

### FORMULARY AMIDOL PAPER DEVELOPER

Directions for mixing and using FORMULARY AMIDOL PAPER DEVELOPER: kit sizes, 1 liter (Catalog number 02-0030); 2 liters (Catalog number 02-0040); and 4 liters (Catalog number 02-0041). Amidol is regarded as one of the finest developers available. It produces rich, strong, black tones, which are slightly cool. Amidol works best on bromide paper where it produces a pleasing tonal range. It can be used at high dilution and yet maintain good print color. Soft-high key prints are especially beautiful when processed in a diluted amidol developer. Because of its unique developing qualities, amidol is the favorite developer of photographers who exhibit their prints.

Although amidol is an excellent developer, it has a number of drawbacks. It is toxic and expensive. It does not keep well in solution. (Its useful life is about 2-3 hours.) And because amidol stains everything it comes into contact with, it is not pleasant to work with.

Formulary Amidol Paper Developer is very similar to Formulary Edward Weston's Paper Developer (Catalog number 02-0010). Weston's amidol developer contains citric acid and more restrainer (potassium bromide) than does Formulary Amidol Paper Developer. The additional restrainer in Weston's Amidol Developer results in prints with greater contrast. Because Formulary Amidol Paper Developer is not acidic, it is a more vigorous developer than is Weston's Amidol.
